8.1 Potential flow around a circular cylinder

A cylinder of radius L is placed in two-dimensional, incompressible, inviscid flow which flows in the direction of $\hat{\imath}$. Far away from the cylinder the velocity field $\mathbf{V}$ can be described as:

$$\mathbf{V} = U\hat{\imath} \tag{6}$$

Where U is some constant. Since the cylinder is impermissible, at the boundary $\mathbf{V} \cdot \hat{n} = 0$ where the vector $\hat{n}$ is the unit vector normal to the surface.

Since in this model the viscocity $\nu = 0$, the flow can be modeled using the Euler equations. If the Euler equations, apply, so does Kelvin's theorem:

Theorem 8.1 (Kelvin's circulation theorem)**.** *The circulation around a closed material loop moving with an inviscid, barotropic fluid in the presence of conservative body forces remains constant over time.*[Citation needed]

If Γ denotes the circulation around a material loop $C(t)$ moving with the fluid, then:

$$\frac{\mathrm{D}\Gamma}{\mathrm{D}t} = 0$$

Id est, if the vorticity of $\mathbf{V}$ is 0 initialy, it must remain 0 everywhere, thus $\nabla \times \mathbf{V} = 0$. Since the flow is irrotational, $\mathbf{V}$ can be expressed as $\mathbf{V} = \nabla\phi$, where ϕ is the velocity potential.

Furthermore, if $\mathbf{V}$ is incompressible, that bieng that $\nabla \cdot \mathbf{V} = 0$, then ϕ must satisfy Laplace's equation: $\Delta\phi = 0$.

8.2 Polar coordinate boundary conditions

8.2.1 $\mathbf{V} = U\hat{\imath}$

In polar coordinates, the base vectors $\hat{r}$ and $\hat{\vartheta}$ are defined as:

$$\hat{r} \overset{\Delta}{=} \hat{\imath}\cos\vartheta + \hat{\jmath}\sin\vartheta$$

$$\hat{\vartheta} \overset{\Delta}{=} -\hat{\imath}\sin\vartheta + \hat{\jmath}\cos\vartheta$$

Solving for $\hat{\imath}$ and $\hat{\jmath}$ gives:

$$\hat{\imath} = \frac{\hat{r} - \hat{\jmath}\sin\vartheta}{\cos\vartheta} \tag{7}$$

$$\hat{\jmath} = \frac{\hat{\vartheta} + \hat{\imath}\sin\vartheta}{\cos\vartheta} \tag{8}$$

Substituting 8 into 7 and isolating $\hat{\imath}$ shows that

$$\hat{\imath} = \frac{\hat{r} - \frac{\hat{\vartheta}+\hat{\imath}\sin\vartheta}{\cos\vartheta}\sin\vartheta}{\cos\vartheta}$$

$$= \frac{\hat{r}}{\cos\vartheta} - \frac{\hat{\vartheta}\sin\vartheta + \hat{\imath}\sin^2\vartheta}{\cos^2\vartheta}$$

$$= \frac{\hat{r}}{\cos\vartheta} - \frac{\hat{\vartheta}\sin\vartheta}{\cos^2\vartheta} - \frac{\hat{\imath}\sin^2\vartheta}{\cos^2\vartheta}$$

$$\implies \hat{\imath} + \frac{\sin^2\vartheta}{\cos^2\vartheta}\hat{\imath} = \frac{\hat{r}}{\cos\vartheta} - \frac{\hat{\vartheta}\sin\vartheta}{\cos^2\vartheta}$$

$$\hat{\imath}\left(1 + \frac{\sin^2\vartheta}{\cos^2\vartheta}\right) = \frac{\hat{r}}{\cos\vartheta} - \frac{\hat{\vartheta}\sin\vartheta}{\cos^2\vartheta}$$

$$\hat{\imath}\left(\frac{\sin^2\vartheta + \cos^2\vartheta}{\cos^2\vartheta}\right) = \frac{\hat{r}}{\cos\vartheta} - \frac{\hat{\vartheta}\sin\vartheta}{\cos^2\vartheta}$$

$$\frac{\hat{\imath}}{\cos^2\vartheta} = \frac{\hat{r}}{\cos\vartheta} - \frac{\hat{\vartheta}\sin\vartheta}{\cos^2\vartheta}$$

$$\hat{\imath} = \hat{r}\cos\vartheta - \hat{\vartheta}\sin\vartheta \quad \blacksquare \tag{9}$$

The condition stated in 6 was that *in infinitum*, $\mathbf{V} = U\hat{\imath}$. By substituting in 9, the statement becomes in terms of $\hat{r}$ and $\hat{\vartheta}$:

$$\text{as} \quad r \to \infty, \quad \mathbf{V} = U(\hat{r}\cos\vartheta - \hat{\vartheta}\sin\vartheta)$$

11

8.2.2 $\mathbf{V} \cdot \hat{n} = 0$

In polar coordinates, the base vector $\hat{r}$ points in the direction of positive change of r, that being outwards from the center. If the cylinder is assumed to be the center of the coordinate system, then $\hat{r}$ will always point normal to the surface of the cylinder. Therefore, at the boundary of the cylinder when $r = L$,

$$\mathbf{V} \cdot \hat{r} = 0$$

8.2.3 $\Delta \phi = 0$

In Cartesian coordinates, the Laplacian operator Δ is defined as $\nabla \cdot \nabla$, which for the scalar field ϕ becomes:

$$\Delta \phi = \frac{\partial^2 \phi}{\partial x^2} + \frac{\partial^2 \phi}{\partial y^2}$$

Translating x and y to polar coordinates and calculating their derivatives with respect to r and ϑ gives:

$$x = r \cos \vartheta, \quad y = r \sin \vartheta$$

$$\frac{\partial x}{\partial r} = \cos \vartheta, \quad \frac{\partial y}{\partial r} = \sin \vartheta \tag{10}$$

$$\frac{\partial x}{\partial \vartheta} = -r \sin \vartheta, \quad \frac{\partial y}{\partial \vartheta} = r \cos \vartheta \tag{11}$$

Consequently, by the chain rule and substitution from 10:

$$\frac{\partial \phi}{\partial r} = \frac{\partial \phi}{\partial x} \frac{\partial x}{\partial r} + \frac{\partial \phi}{\partial y} \frac{\partial y}{\partial r}$$

$$= \frac{\partial \phi}{\partial x} \cos \vartheta + \frac{\partial \phi}{\partial y} \sin \vartheta \tag{12}$$

Taking the derivative of 12 with respect to r again gives:

$$\frac{\partial^2 \phi}{\partial r^2} = \frac{\partial}{\partial r}\frac{\partial \phi}{\partial x}\cos\vartheta + \frac{\partial}{\partial r}\frac{\partial \phi}{\partial y}\sin\vartheta$$
$$= \frac{\partial}{\partial x}\frac{\partial \phi}{\partial r}\cos\vartheta + \frac{\partial}{\partial y}\frac{\partial \phi}{\partial r}\sin\vartheta \tag{13}$$

Substituting 12 into 13 gives:

$$\frac{\partial^2 \phi}{\partial r^2} = \frac{\partial}{\partial x}\left(\frac{\partial \phi}{\partial x}\cos\vartheta + \frac{\partial \phi}{\partial y}\sin\vartheta\right)\cos\vartheta + \frac{\partial}{\partial y}\left(\frac{\partial \phi}{\partial x}\cos\vartheta + \frac{\partial \phi}{\partial y}\sin\vartheta\right)\sin\vartheta$$
$$= \frac{\partial^2 \phi}{\partial x^2}\cos^2\vartheta + \frac{\partial^2 \phi}{\partial x\partial y}\sin\vartheta\cos\vartheta + \frac{\partial^2 \phi}{\partial y\partial x}\cos\vartheta\sin\vartheta + \frac{\partial^2 \phi}{\partial y^2}\sin^2\vartheta$$
$$= \frac{\partial^2 \phi}{\partial x^2}\cos^2\vartheta + 2\frac{\partial^2 \phi}{\partial x\partial y}\sin\vartheta\cos\vartheta + \frac{\partial^2 \phi}{\partial y^2}\sin^2\vartheta \tag{14}$$

Applying the same process for $\frac{\partial \phi}{\partial \vartheta}$ with substitution from 11 yields:

$$\frac{\partial \phi}{\partial \vartheta} = \frac{\partial \phi}{\partial x}\frac{\partial x}{\partial \vartheta} + \frac{\partial \phi}{\partial y}\frac{\partial y}{\partial \vartheta}$$
$$= -\frac{\partial \phi}{\partial x}r\sin\vartheta + \frac{\partial \phi}{\partial y}r\cos\vartheta \tag{15}$$

Taking the derivative of 15 with respect to ϑ again gives:

$$\frac{\partial^2 \phi}{\partial \vartheta^2} = -\frac{\partial}{\partial \vartheta}\frac{\partial \phi}{\partial x}r\sin\vartheta + \frac{\partial}{\partial \vartheta}\frac{\partial \phi}{\partial y}r\cos\vartheta$$

Since both terms contain a product of two functions dependent on ϑ the product rule needs to be applied. This gives:

$$\frac{\partial^2 \phi}{\partial \vartheta^2} = -\frac{\partial^2 \phi}{\partial \vartheta\partial x}r\sin\vartheta - \frac{\partial \phi}{\partial x}r\cos\vartheta + \frac{\partial^2 \phi}{\partial \vartheta\partial y}r\cos\vartheta - \frac{\partial \phi}{\partial y}r\sin\vartheta$$
$$= -r\left(\frac{\partial \phi}{\partial x}\cos\vartheta + \frac{\partial \phi}{\partial y}\sin\vartheta\right) + r\frac{\partial \phi}{\partial \vartheta}\left(-\frac{\partial}{\partial x}\sin\vartheta + \frac{\partial}{\partial y}\cos\vartheta\right) \tag{16}$$

Substituting 15 into 16 gives:

$$\frac{\partial^2 \phi}{\partial \vartheta^2} = -r\left(\frac{\partial \phi}{\partial x}\cos\vartheta + \frac{\partial \phi}{\partial y}\sin\vartheta\right) + r\underbrace{\left(-\frac{\partial \phi}{\partial x}r\sin\vartheta + \frac{\partial \phi}{\partial y}r\cos\vartheta\right)\left(-\frac{\partial}{\partial x}\sin\vartheta + \frac{\partial}{\partial y}\cos\vartheta\right)}_{\Phi}$$

(17)

Expanding Φ:

$$\begin{aligned}
\Phi &= \left(-\frac{\partial \phi}{\partial x}r\sin\vartheta + \frac{\partial \phi}{\partial y}r\cos\vartheta\right)\left(-\frac{\partial}{\partial x}\sin\vartheta + \frac{\partial}{\partial y}\cos\vartheta\right)\\
&= \left(-\frac{\partial \phi}{\partial x}r\sin\vartheta\right)\left(-\frac{\partial}{\partial x}\sin\vartheta\right) + \left(-\frac{\partial \phi}{\partial x}r\sin\vartheta\right)\left(\frac{\partial}{\partial y}\cos\vartheta\right)\\
&\quad + \left(\frac{\partial \phi}{\partial y}r\cos\vartheta\right)\left(-\frac{\partial}{\partial x}\sin\vartheta\right) + \left(\frac{\partial \phi}{\partial y}r\cos\vartheta\right)\left(\frac{\partial}{\partial y}\cos\vartheta\right)\\
&= \frac{\partial^2 \phi}{\partial x^2}r\sin^2\vartheta - 2\frac{\partial \phi}{\partial x\partial y}r\cos\vartheta\sin\vartheta + \frac{\partial^2 \phi}{\partial y^2}r\cos^2\vartheta
\end{aligned}$$

Substituting Φ back into 17 gives:

$$\begin{aligned}
\frac{\partial^2 \phi}{\partial \vartheta^2} &= -r\left(\frac{\partial \phi}{\partial x}\cos\vartheta + \frac{\partial \phi}{\partial y}\sin\vartheta\right) + r\left(\frac{\partial^2 \phi}{\partial x^2}r\sin^2\vartheta - 2\frac{\partial \phi}{\partial x\partial y}r\cos\vartheta\sin\vartheta + \frac{\partial^2 \phi}{\partial y^2}r\cos^2\vartheta\right)\\
&= r^2\left(\frac{\partial^2 \phi}{\partial x^2}\sin^2\vartheta - 2\frac{\partial \phi}{\partial x\partial y}\cos\vartheta\sin\vartheta + \frac{\partial^2 \phi}{\partial y^2}\cos^2\vartheta\right) - r\left(\frac{\partial \phi}{\partial x}\cos\vartheta + \frac{\partial \phi}{\partial y}\sin\vartheta\right)\\
&= r^2\left(\frac{\partial^2 \phi}{\partial x^2}\sin^2\vartheta - 2\frac{\partial \phi}{\partial x\partial y}\cos\vartheta\sin\vartheta + \frac{\partial^2 \phi}{\partial y^2}\cos^2\vartheta\right) - r\frac{\partial \phi}{\partial r}
\end{aligned}$$

(18)

Combining 14 and 18 yields:

$$\begin{aligned}
\frac{\partial^2 \phi}{\partial r^2} + \frac{\partial^2 \phi}{\partial \vartheta^2} &= \frac{\partial^2 \phi}{\partial x^2}\cos^2\vartheta + 2\frac{\partial^2 \phi}{\partial x\partial y}\sin\vartheta\cos\vartheta + \frac{\partial^2 \phi}{\partial y^2}\sin^2\vartheta\\
&\quad + r^2\left(\frac{\partial^2 \phi}{\partial x^2}\sin^2\vartheta - 2\frac{\partial \phi}{\partial x\partial y}\cos\vartheta\sin\vartheta + \frac{\partial^2 \phi}{\partial y^2}\cos^2\vartheta\right) - r\frac{\partial \phi}{\partial r}\\
\implies \frac{\partial^2 \phi}{\partial r^2} + \frac{1}{r^2}\frac{\partial^2 \phi}{\partial \vartheta^2} &= \frac{\partial^2 \phi}{\partial x^2}\cos^2\vartheta + \frac{\partial^2 \phi}{\partial x^2}\sin^2\vartheta + \frac{\partial^2 \phi}{\partial y^2}\cos^2\vartheta + \frac{\partial^2 \phi}{\partial y^2}\sin^2\vartheta - \frac{1}{r}\frac{\partial \phi}{\partial r}\\
&= \frac{\partial^2 \phi}{\partial x^2} + \frac{\partial^2 \phi}{\partial y^2} - \frac{1}{r}\frac{\partial \phi}{\partial r}\\
\implies \frac{\partial^2 \phi}{\partial x^2} + \frac{\partial^2 \phi}{\partial y^2} &= \frac{\partial^2 \phi}{\partial r^2} + \frac{1}{r}\frac{\partial \phi}{\partial r} + \frac{1}{r^2}\frac{\partial^2 \phi}{\partial \vartheta^2}\\
\therefore \Delta\phi &= \frac{\partial^2 \phi}{\partial r^2} + \frac{1}{r}\frac{\partial \phi}{\partial r} + \frac{1}{r^2}\frac{\partial^2 \phi}{\partial \vartheta^2} \quad \blacksquare
\end{aligned}$$

(19)

8.3   Ad confluōrem

Summarized, the conditions translated to polar form in sections 8.2.1, 8.2.2 and 8.2.3 are:

$$\mathbf{V} = U(\hat{r}\cos\vartheta - \hat{\vartheta}\sin\vartheta) \qquad \text{as} \qquad r \to \infty$$

$$\mathbf{V} \cdot \hat{r} = 0 \qquad \text{when} \qquad r = L$$

$$\frac{\partial^2\phi}{\partial r^2} + \frac{1}{r}\frac{\partial\phi}{\partial r} + \frac{1}{r^2}\frac{\partial^2\phi}{\partial\vartheta^2} = 0$$
